No. 15

BOTULISM AND SPOILED CANNED FOOD.

From time to time there have been published in the Public Health Reports accounts of outbreaks of botulism which were definitely traced to the eating of canned goods which presented recognized evidence of spoilage, and warning has been given against the use of all canned food which shows the least sign of being spoiled.

The Bureau of Chemistry, Department of Agriculture, has recently investigated a fatal case of botulinus poisoning which occurred in Seattle in the latter part of February, 1921. The facts of prime importance in this case were: (1) That the poisoning was due to the eating of home-canned string beans; (2) that the method of canning appears to have been an approved one; (3) that the servant recognized the spoilage; (4) that the patient (Mrs. M. A. L.), in spite of the recognition of the spoiled condition of the food, ate enough to cause her death; and (5) that three small pieces of bean were sufficient to cause death.

In an article¹ published in Public Health Reports for February 13, 1920, it was stated: "As a further measure of precaution, no food of any description showing even the slightest unnatural odor, unnatural color, swelling of the container, signs of gas, or any evidence of decomposition whatever, should be used for food purposes. In practically every case of botulism the food was shown to have had an offensive or abnormal odor. While all spoiled food may not contain *Bacillus botulinus*, any spoiled food, even though the spoilage be slight, may contain it, and, in view of the fatal effect of very small amounts of the toxin which this organism generates, the only safe rule is to examine carefully all food products before they are served and to discard those which are even slightly suspicious."

It is evidently impossible to accomplish the removal of all spoiled food from the market or to provide against all conditions in which spoiled food may be presented to the housekeeper from time to time. In view of these limitations it is necessary to bring about a general recognition of the dangerous character of food which shows clear physical evidences of spoilage, and to call attention to the stringent necessity of discarding all canned goods deviating from the normal.

¹ Botulism—Protective Measures and Cautions from the Bureau of Chemistry, U. S. Department of Agriculture: Public Health Reports, Feb. 13, 1920, pp. 327-330.

Other observations made by the representative of the Bureau of Chemistry on the recent case in Seattle are of interest to persons engaged in the study of the distribution of spores of *B. botulinus* in nature. These relate to spore-bearing soil and endemic foci.

The beans in this case were grown on a farm at Yelms, Wash., where, about a year previously, six hogs became sick, presenting symptoms resembling botulism poisoning. Two died. The hogs were not fed on garbage and were kept in the open. The ground had not been cultivated.

It is possible that this ranch is an endemic focus of *botulinus* infection, and the Bureau of Chemistry has secured samples of the soil and of the hog dung for bacteriological examination.

THE NOTIFIABLE DISEASES.

PREVALENCE DURING 1919 IN CITIES OF 10,000 TO 100,000.

ANTHRAX, CEREBROSPINAL MENINGITIS, DIPHTHERIA, INFLUENZA, MALARIA, MEASLES, PELLAGRA, PNEUMONIA (ALL FORMS), POLIOMYELITIS (INFANTILE PARALYSIS), RABIES IN ANIMALS, RABIES IN MAN, SCARLET FEVER, SMALLPOX, TUBERCULOSIS (ALL FORMS AND PULMONARY), AND TYPHOID FEVER—CASES REPORTED, CASE RATES, DEATHS REGISTERED, DEATH RATES, FATALITY RATES, AND AVERAGE NUMBER OF CASES REPORTED DURING PRECEDING YEARS.

The tables shown on the following pages were compiled from data furnished by the health officers of cities. Requests for information were sent to all cities of the United States having 10,000 population or more. The data for cities having more than 100,000 population were published in the Public Health Reports, volume 35, No. 51, December 17, 1920. Similar data for States were published in the Public Health Reports, volume 36, No. 8, February 25, 1921.

The present article contains reports from cities having between 10,000 and 100,000 population which responded to the request for information. It is believed that practically all cities are included which have records of morbidity from communicable diseases which are of value for statistical purposes.

The populations given and which were used in computing the rates were estimated as of July 1, 1919, from the preliminary reports of the census of January 1, 1920, and the reports of the census of April 15, 1910. The figures given probably differ somewhat from estimates which will be made later, which will be based on the final reports of the 1920 census and will take into consideration changes in area of the cities between 1910 and 1920, data for which are not now available. The differences, however, will probably not be such as to seriously affect the rates given in the tables.

The columns under "Averages" show the number of years for which data were available and the average number of cases reported during those years. Where information was obtainable the averages were computed by adding together the number of cases reported during

the five years 1914 to 1918, inclusive, and dividing the sum by five. For many cities, however, the figures for the full five years were not available, and for these cities the averages were computed for as many years as possible, but no data for years earlier than 1914 are included in the tables.

The epidemic of poliomyelitis in 1916 affected many cities, and where the increase in the number of cases of this disease during that year was sufficient to considerably raise the average, the year was not included in the computation of the average.

In comparing the figures for 1919 with the averages for preceding years, it should be borne in mind that there has been a gradual improvement in the reporting of communicable diseases during the last few years. An increase in the number of cases reported may be due to better reporting of the particular disease rather than to an increase in the number of cases existing.

In studying these tables it should be kept in mind that a relatively large number of reported cases of a communicable disease as indicated by a high case rate (and more especially when accompanied by a relatively small number of deaths, as indicated by a low fatality rate) usually means that the health department of that city is active and that the cases of the disease are being well reported by the practicing physicians. It does not usually mean that the disease is more prevalent in that city than in other cities. A high fatality rate may mean that the disease was unusually virulent in a city, that the physicians did not treat the disease in that city with the success usual elsewhere, or that the practicing physicians did not report all of their cases to the health department. On the other hand, an unusually low fatality rate may be due to the fact that the disease in the city was unusually mild, that the physicians treated it with unusual success, that the practicing physicians reported their cases satisfactorily, or that the registration of deaths was incomplete, or the assignment of the causes of death inaccurate.

Cities in which no cases of a certain disease were reported are not included in the table for that disease.

Reported Prevalence, 1919—Averages for Previous Years.

COURT CONSTRUES NEW MEXICO ACT CREATING HEALTH AUTHORITIES.

The Supreme Court of New Mexico has decided¹ that the State department of health can perform health work within a county and charge the county therefor when the county fails to appoint a health officer who meets with the approval of the State department of health.

The law provides that each board of county commissioners shall appoint a county health officer, said appointment to be subject to the approval of the State department of health. The law also enumerates in detail the powers of the State department of health, and declares it shall have power "to supervise the work of local health authorities; to promulgate rules and regulations governing the same; and to perform the said work in case said authorities fail, neglect, or refuse to do so, at the expense of the county or municipality affected."

The county of San Miguel appointed a health officer, but the appointment was disapproved by the State department of health. No other person was appointed by the county, and the State department of health performed the health work within the county and presented a claim therefor to the county, which claim the county refused to pay. This raised the question as to whether the county, by failing to appoint another health officer who would meet with the approval of the State department of health, had failed, neglected, or refused to perform the work. Regarding this the court said:

* * * The State department, under section 12, has the power to approve or disapprove the appointment made by the board of county commissioners, and until the appointment is approved by the State department there is no such officer as the county health officer provided for in the act.

It follows that an appointment made by the county commissioners which the State department has not approved, prevents the work which the State department is authorized to perform under section 10 from being performed in the manner required by law, and the failure of the State department of health to approve of the appointment made by the county commissioners constitutes, in our opinion, a failure, neglect, or refusal of the local health authorities to perform the work outlined in section 10, and gives the right and authority to the State department of health to perform the work at the expense of the county.

¹ State Department of Health v. San Miguel County, 195 Pac. 805.

PRINCIPAL CAUSES OF DEATH, JANUARY AND FEBRUARY, 1921.

The accompanying table is reprinted, by permission, from the Statistical Bulletin of the Metropolitan Life Insurance Co. for March, 1921. The figures are based on a strength of approximately 13,000,000 insured persons.

Although these rates apply to a more or less selected group, they are very good indices of comparative mortality conditions of the general population.

It is of interest to note that the death rate for February, 1921, is lower than that for the entire year 1920.

Death rates (annual basis) per 100,000 for principal causes, January and February, 1921, and year 1920.

[Industrial Department, Metropolitan Life Insurance Co.]

Cause of death.	Death rate per 100,000 lives exposed.

¹ Annual rate per 1,000 population.

² "A" indicates data for the corresponding week of the years 1913 to 1917, inclusive. "C" indicates data for the corresponding week of the year 1918.

³ Deaths under 1 year per 1,000 births—an annual rate based on deaths under 1 year for the week and estimated births for 1920. Cities left blank are not in the registration area for births.

* Enumerated population Jan. 1, 1920.

† Data based on statistics of 1915, 1916, and 1917.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.

SUMMARY OF CASES REPORTED MONTHLY BY STATES.

The following summary of monthly State reports is published weekly and covers only those States from which reports are received during the current week:

State.	Cerebrospinal meningitis.	Diphtheria.	Influenza.	Malaria.	Measles.	Pellagra.	Polyomyelitis.	Scarlet fever.	Smallpox.	Typhoid fever.
1921.										
Montana (February).....	1	35	3	684	72	99	3
Nebraska (March).....	4	49	3	285	241	426	4
Wisconsin (March).....	4	333	97	522	3	1,003	832	34

RECIPROCAL NOTIFICATION.

Massachusetts—March, 1921.

Cases of communicable diseases referred during March, 1921, to other State health departments by Department of Health of the State of Massachusetts.

Disease and locality of notification.	Referred to health authority of—	Why referred.
Typhoid fever: Fall River.....	State health department, Hartford, Conn.	Patient visited at Mystic, Conn., prior to onset of disease.

PLAQUE.¹

HUMAN CASES OF PLAQUE REPORTED.

Place.	Period covered.	Cases.	Deaths.	Remarks.
California: San Benito County.....	1921. Feb. 7.....	1	

¹ A summary of the reports received of the occurrence of plague and the finding of plague-infected rodents in the United States during 1920 was published in Public Health Reports, Jan. 7, 1921, p. 15.

PLAQUE-INFECTED RODENTS.

April 15, 1921.

CITY REPORTS FOR WEEK ENDED MAR. 26, 1921—Continued.

TYPHOID FEVER.

The column headed "Median for previous years" gives the median number of cases reported during the corresponding weeks of the years 1915 to 1920, inclusive. In instances in which data for the full six years are incomplete, the median is that for the number of years for which information is available.

CITY REPORTS FOR WEEK ENDED MAR. 26, 1921—Continued.

DIPHTHERIA, MEASLES, SCARLET FEVER, AND TUBERCULOSIS--Continued.

FOREIGN AND INSULAR.

CHINA.

Plague—Harbin.

Ninety fatal cases of plague occurred at Harbin, Manchuria Province, China, March 26, 1921. It is reported that the plague situation is becoming worse.

CUBA.

Communicable Diseases—Habana.

Communicable diseases have been notified at Habana as follows:

Disease.	Mar. 11-21, 1921.		Remaining under treatment Mar. 21, 1921.
	New cases.	Deaths.

JAMAICA.

Infectious Disease (Alastrim or Kaffir Pox).

During the week ended March 19, 1921, 188 new cases of alastrim or Kaffir pox were reported in the Island of Jamaica.

JAPAN.

Quarantine Station—Nagoya.

According to information dated February 13, 1921, a quarantine station was to be opened at the port of Nagoya, Japan, March 3, 1921.

UNION OF SOUTH AFRICA.

Plague—Plague-Infected Wild Rodents—Typhus Fever.

During the week ended February 26, 1921, a death from plague was reported in the Kroonstad district of the Orange Free State, Union of South Africa. The case was previously reported as occurring on a farm in the Bothaville area. The carcasses of two wild rodents taken from this locality were found plague infected, thus

confirming the suspicion referred to in the report for the week ended December 4, 1920,¹ that infection exists among and is being perpetuated and spread by wild rodents and probably also by smaller carnivora.

During the week ended February 26, 1921, fresh outbreaks of typhus fever were reported in the Cape Province, Union of South Africa.

CHOLERA, PLAGUE, SMALLPOX, TYPHUS FEVER, AND YELLOW FEVER.
